

Earmark

Fundraisers where the money can only go to a verified recipient, or back to the donors. Never to the organizer.

HackYeah 2026 · Superteam Poland: **Finance Without Intermediaries** · Built on Solana

THE PROBLEM

In 2017, Poles donated to save a boy's sight. The boy never existed.

6 500

people donated on a Polish
crowdfunding platform

500k zł

raised for "Antoś", a made-up
story

1

organizer received it all and spent
it on himself

The platform held the money and paid the organizer. Everything else was trust. More vetting by the platform only moves that trust from one party to another.

THE SOLUTION

A vault with exactly two exits, written in code

A database operator can edit balances and pay anyone. On Solana, these two exits are code that even its authors cannot bypass, and anyone can check every transfer.

HOW IT WORKS

Four steps, each one a public transaction

1

Verify once

A verifier links a wallet to a registered organisation (KRS, RPWDL). Once per organisation, not per fundraiser.

2

Create

The organizer sets the recipient, target and deadline, plus the SHA-256 of the invoice. These cannot be changed later.

3

Confirm

The recipient confirms the document hash on-chain. No donations are accepted before that.

4

Pay out or refund

The donation that hits the target pays the recipient in the same transaction. Otherwise a keeper refunds every donor.

WHO CAN DO WHAT

Nobody holds the power to redirect money

ROLE	CAN	CANNOT
Verifier	mark a wallet as a verified recipient, revoke it	move any money, create or cancel fundraisers
Organizer	create a fundraiser, cancel it before payout	receive any money, change target, recipient or deadline
Recipient	confirm or cancel a fundraiser naming it	withdraw before the target is reached
Donor	donate, get refunded after a cancel or missed deadline	receive anyone else's refund
Us	nothing, once the upgrade authority is final	edit balances, pay out, block refunds

One question left: does this wallet belong to this organisation?

Bounded

The verifier can't move money

The worst case if its key leaks is a fake recipient. That is visible on-chain, and recipients verified in the last 7 days are flagged on /audit.

Re-checkable

Check it yourself

The registry number is stored on-chain, and every fundraiser page links to the official KRS / RPWDL search. Any invoice file can be checked against the confirmed hash right in the browser.

Production

Not us

A multisig council of independent parties, then attestations from banks' KYB checks via the Solana Attestation Service.

If the organizer and the recipient collude, the thief is a registered legal entity that signed the invoice on-chain under its own name, not an anonymous person.

Works end to end on Solana devnet

Anchor program

- all money rules on-chain
- auto payout, permissionless refunds
- 23 integration tests

Web app

- screens for donors, organizers, recipients, verifier
- public /audit page with fraud flags
- live at earmark.help

Around it

- keeper bot that refunds automatically
- ePLN test stablecoin and faucet
- card on-ramp (Ramp Network)

No medical or personal data on-chain, only document hashes. The token is a single config field, so a regulated PLN or EUR stablecoin can replace ePLN.

One primitive: money that can only be spent as intended

Disaster relief

paid directly to
suppliers

NGO and public grants

released on milestones

Benefits

from employers or
insurers, spendable
only as intended

City co-funding

"residents raise X and
the city adds Y,
otherwise refund"

Next steps

Multisig verifier council → Solana Attestation Service · registry API integration · regulated stablecoin with BLIK / SEPA on-ramp · milestone payouts · Polish UI · pilot with a Polish hospital or foundation

Try it

App	<code>earmark.help</code>
Code	<code>github.com/Softjey/earmark</code>
Video	<code>youtu.be/xNkNep-AmJg</code>
Program	<code>GWaY7mkSSwBzK6KfSGEJa9EriyvyE5k25yZQ9q4PCfMf</code>

Phantom on Devnet → devnet SOL from faucet.solana.com → free ePLN from the app's faucet → donate.
